NATIONAL INSTRUMENTS

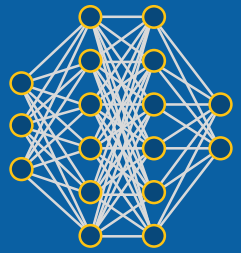
Deep Learning for Self-Driving Cars

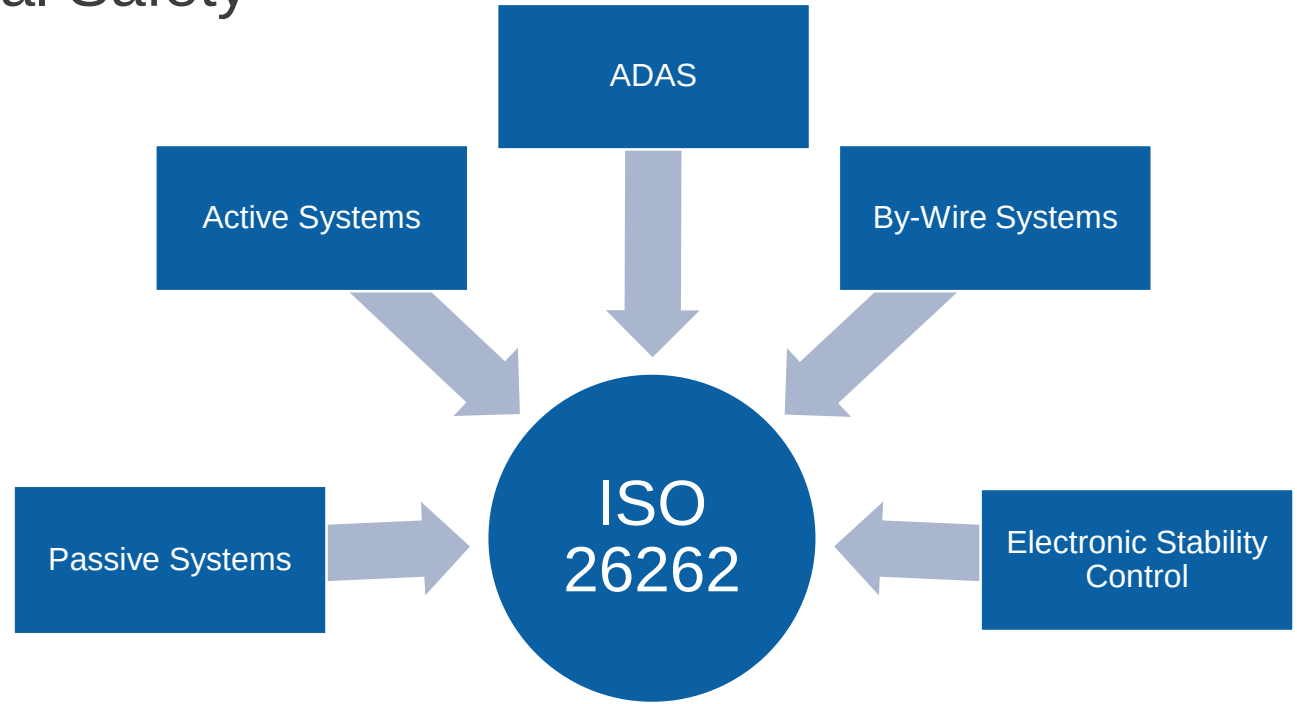


DEEP NEURAL NETWORK

- Environmental perception is key to autonomous driving, e.g., lane position
- Traditional feature recognition and image processing techniques don’t scale to needed complexity
- Deep neural networks learn efficient feature representation
- Inductive learning leads to evolving software operation that is challenging to test

Functional Safety

ISO 26262



All interactions between systems of systems must be known and tested to determine how errors propagate across system and subsystem boundaries.

NATIONAL INSTRUMENTS

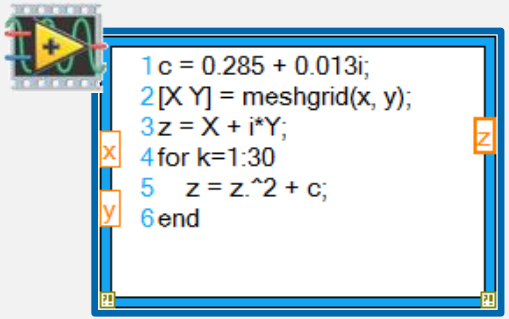
Test Methodology

Benefits and Trade-Offs of Testing Approaches

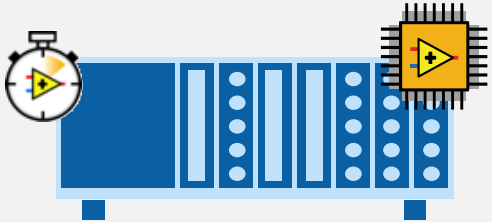
Simulation

- Uses software-only techniques
- Lowers setup complexity
- Does not truly emulate real-world behavior



Emulation

- Uses hardware-in-the-loop (HIL) techniques
- Allows the emulation of real-world scenarios
- Scales for future applications
- Requires knowledge of both hardware and software



Field Test

- Offers true real-world test
- Is difficult to set up and scale
- Limits test case coverage due to time and space complexity

V2V and V2I Communications With 802.11p and LTE

IEEE 802.11p (DSRC)

- Referred to as Dedicated Short-Range Communication (DSRC)
- Uses unlicensed spectrum in 5.9 GHz band
- Based on half-clocked IEEE 802.11a/g with 10 MHz channel bandwidth
- Effective Tx-Rx velocity differences of up to 200 km/hr
- Supports only V2V communication

LTE V2X (Cellular V2X)

- Part of 3GPP Release 14; targeted for 2017
- Uses existing licensed LTE spectrum and infrastructure
- Bandwidth configurations up to 10 MHz
- GNSS-based symbol synchronization
- Supports both V2V (PC5) and V2I (Uu) modes

NATIONAL INSTRUMENTS

NI’s Approach for Integrating Other Standards

Flexible measurement IP from GSM to Wi-Fi

Partner IP	
WLAN (802.11a/b/g/n/ac)	GSM/EDGE
Bluetooth	WCDMA/HSPA+
GPS Generation	CDMA2k
FM/RDS Generation	LTE/LTE-A (TDD & FDD)

Wireless measurement algorithms execute on PXI controllers and reconfigurable FPGAs.

Radar

Trends in Automotive Radar

Focus on Safety

- Object identification/distinction
- Rear-end crash avoidance
- CAR2X (Car 2 Car and Car 2 Infrastructure Communication)
- 360 degrees vehicle surveillance

Adoption of 77–81 GHz

- More reliability and more accuracy
- Greater capability of distinguishing objects with high bandwidth
- Smaller footprint (multimode, multirange)

NATIONAL INSTRUMENTS

Vehicle Radar Test System (VRTS)

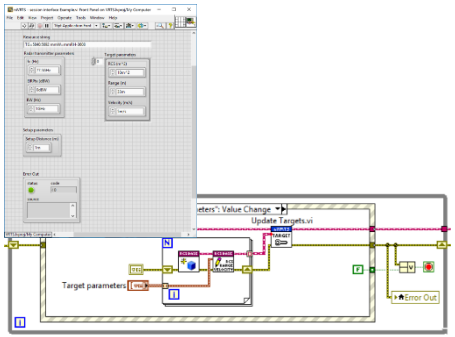
FEATURES AT A GLANCE

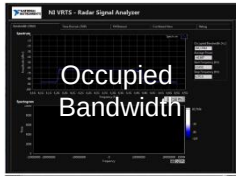
- Single system performs both obstacle simulation and radar measurements
- Obstacle simulation settings include velocity, range, RCS, and angle of arrival (Ao))
- Measurements include: radiation pattern, EIRP, phase noise, spectrum occupancy, beam width, and chirp analysis
- Tight synchronization with modular PXI hardware for hardware-in-the-loop (HIL) and ADAS test applications

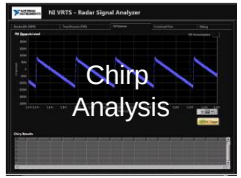
The NI VRTS is a flexible test system that combines PXI hardware with modular milimeterwave radio heads

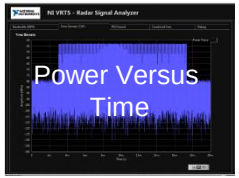
KEY SPECIFICATIONS

- Frequency Range: 76 – 81 GHz
- Number of Obstacles: 2 to 8+
- Obstacle range: 4m to 300+ meters
- Minimum VRTS to DUT: 70 cm
- Range resolution: 10 cm
- Range Accuracy: ± 70 cm
- Velocity: 0 to 500 km/hr (75 kHz)









NATIONAL INSTRUMENTS

“With the PXI Vector Signal Transceiver, the combination of the industry’s widest bandwidth and low latency software has allowed us to discover our automotive radar sensors as never before.”
